Quick question, if my video card has 2 DVI connections and 1 HDMI could I run 3 monitors?

No. Limitations with nVidia's cards mean they cannot support three displays at once. You can hook three screens in, but only two will work.

You'll need a second video card to have three displays.

So with dual cards can we have 3 or 4 monitors?

Yeah, although four monitors won't work too well for nVidia Surround.

If you just want a larger Windows desktop, I believ you can just use a second nVidia card. It can be a cheap 8400GS, or 9600GT if you desire. But games will not run on all three monitors, just your primary one.

If you want a game to run on three monitors using nVidia Surround, then you need two matching cards in SLI. I'd tread carefully. I've been playing with Surround, and haven't been too thrilled with the results. Plus, it's very finicky about the monitors you use and their refresh rates, and sync polarities. I spent quite a lot of time researching my options, and I'm thinking I'll be returning my third monitor because of the hassles.

You can't be serious? Is it like on ATI cards where you can only utilize 2xDVI or 1xDVI and 1xHDMI, then using a display port for the third? Or can you not use three at all?

No, nVidia's architecture is different than ATI's. You can hook three monitors, 2xDVI and 1xHDMI at once, but only two can be enabled at a time.

Depending on your viewpoint, it's not necessarily a bad thing. If you aim to game with three monitors in a Surround or Eyefinity environment, a second card is almost necessary if you want an enjoyable experience. After all, just because a 5670 will run three monitors does not mean it will do it well. However, for more general purposes, AMD's solution is superior.

A cheap one with sli?

No, SLI only applies to cards that are exactly the same, and increases performance in games. You need an SLI 'bridge' connector for it to work.

A cheap card that is paired with your GTX 460 will not boost gaming performance, but it will let you use three or four monitors to display your Windows desktop. However, if you play a game, only one monitor that is hooked up to your 460 will display the graphics.

So: If you want a game that spans three monitors, you need a GTX 460 that is exactly like yours in specification.

But, if you just want a large Windows Desktop, then you can likely use a cheap nVidia card.

http://www.amd.com/US/PRODUCTS/TECHNOLOGIES/AMD-EYEFINITY-TECHNOLOGY/Pages /eyefi nity.aspx

I personally have a AMD Radeon 6850 with three monitors and it looks great with all three going. This technology can use up to 6 monitors per one card, of course this depends on which AMD card you purchase. The driver software lets you group monitors and it makes this group appear as only one monitor to the OS, it just has a huge resolution.

My only problem is that I cannot do it all the time because I do not have the desk space for all three (I had to put one on a lower side table next to my computer desk during testing).

ha ha, depends whether you want a graphics card that can do fancy looking things or one that can give excellant game performance.

Stick with nvidia for all gaming related stuff. As far as video etc... nividia isn't the best

Edit: just saw date of last post oh well

I gave up on trying to get nVidia Surround working properly. For most people, it is seamless, but not for me. I do believe it may be one of my monitors' EDID being corrupted, though.

However, I don't want to discourage either Surround or Eyefinity. On the few occasions where things worked, it was incredible. Traversing a mountain in Just Cause 2, then jumping off of it made my jaw drop. But you really need to put in the time to make things as compatible as possible; if you just want to play games with little hassle, buy one nice big monitor, and enjoy.

i run 2xATI 6950's, i run 6 screens, using displayport monitors.

if you have the money, do it.
