Hello,

here is attached crashdump from Jelly Marathon.

Description:
My dad shoot with arty GDI ref on Islands.mix
I destroyed GDI ref with my arty and he crashed.

And to the TT team, Jelly is now on 4.0.

I heard that the performance went up tremendously, can you say something about that Xpert?

What are you indicating or implying?

I heard that the SFPS went up, on a full server. Since this is third-hand information, I would love to hear exact numbers.

Try 40 SFPS on a full game to 130 SFPS. Fucking mind blowing performance improvement.

Ya, the SFPS was set higher than 60. Either way, it was silky smooth ingame. People didn't move like it was tetris.

Then you weren't there when the issues were fixed.

We had the server running with 50 people in game and a consistent 100 SFPS. I also know for a fact that we can likely push that higher.

It was extremely smooth to play in.

CPU usage is about the same but I can't give you any data on bandwidth.

I'm waiting for someone to create a mass of light or medium tanks to see how the server handles all of the extra objects floating around. On the 3.4 FDS SFPS would drop to about 45.

actually it would be around 35 even on islands with a lot less tanks

[22:35:34] <&JellyMarathon> Gameinfo: (WOL) Map: C&C_Volcano.mix GDI: 17/50 players
24812 points Nod: 15/50 players 20863 points 0.00.00 mins left SFPS: 333

Was fluctuating a fair amount though. Between 270-340.

I can reproduce this:

- Host ope player LAN game on client.
- Quit client game.
- Join online game.
- Kill ref.

It probably happens when hosting any game (SP, LAN, WOL) and then joining a non-hosted game.

Thanks for the details in your first post, (map name and destroying ref) that really helped figuring it out. There are quite a few similar crashes that I believe will be fixed once this one is fixed.
