mrpirateThat's a very misleading statement, considering his original question. There would be almost no difference between the performance of a 9700 Pro plugged into an 8x AGP bus, or a 4x AGP bus.

What is the difference between a 4x bus and an 8x? Because if I get a Radeon 9700, I would like it to last for at least a year or two, and become outdated about when my GeForce 2 is, when new games start coming out with features the card can't handle. Would, say, Splinter Cell: PT run well with a 9700 in a 4x slot?
