RipintouSounds like your having the same problems as this guy http://www.renegadeforums.com/viewtopic.php?t=12692 except your system looks like it barely makes the minimum requirements and your memory omg, get some memory. Update your Realtek sound driver/codec here >> http://www.realtek.com.tw/products/products.aspx or better still get an audio card.

I'd say the combination of lack of memory and a decent sound card crashes you to desktop.

My son plays on a 1600 with 256 mb ram and it runs fine. Only diffference I can see is load up time.

By the way Ripintou not everyone can have a gig of ram some cant afford it.
