Thats normal, I am not sure whether its something that the author thought best to do or that they are simply not able to change the css before the site fully loads, either way the split second where it shows the large font is normal.

I'd also like to mention that this extension can be used in other ways as well, any site that uses css can be edited by using the same userContent.css code, however css knowledge is recommended but for those that do know css it can be a useful tool in customizing sites that you frequently visit.

As far as chromedit goes, did you get chromedit to work? If not instead of installing it directly try first downloading the xpi file and then opening the extension window and then dragging and dropping the xpi file into the extension window.
