That's what the cluster will about look like (this has no functionality as the LEDs are just sticked onto the PCB).
Didn't decide yet if I will control them multiplexed (loop through all rows and set the row either on or off depending on what the flag in the driver µC is set to) or 13 latches (13*8 = 104, 100 LEDs) with transistors, while option 1 is easier to use (less soldering work). Option 2 however, has the better performance.
