To explain better why there is so much source code:

Let's say you set up a site and add a some scripts. You will have SOME coding to do at first, and it might be a lot. Now suppose you set it up so that you can use an external program to easily add content to it. You might have a sort of template for your homepage, in the content bit where you update, and you just add things like the title, content, whatever. You won't be doing all of this from code every time you add things to your site; PHP or whatever you use will do that automatically because you have set it up to do so. All you will do is use the program and type your update in; it'll take all your stuff and give it its code version. Your program will say "I see your modification; I raise you a heck of a lot of code that results from it". It's like adding a button to a windows form on visual studio; you add the button and the program generates the code needed(of course you can do that yourself if you want). cncden has been getting updated for a long time, go figure.
