Uhh... Generally when something requires more memory, it's not going to allow your computer to operate as fast as it should.

X Wrong answer, ditchwitch.

Generally, when something requires more memory, it means it's a larger program, that's about it.

About the only time it would cause any type of performance issue is if you had 1MB of available memory left and the extra two FireFox used would throw you out to the page file.. If that were the case, FF is the least of your problems.

You're still a retard, generally speaking of course.
