---

well i decided to pick renegade 1es more out the shells

any how, i'm now running the new os from our "friends" Microsoft

and the normal renegade would NOT work, though i applied a no-cd crack and now every thing works just fine...

though i can not run renguard, if i try to run the reguard program it will just crash game.exe (reguard edition)

any fix on this??

or perhaps a special x64 edition? why? well since the next os from microsoft

windows vista (former windows longhorn)

will also be in 2 flavors 32bits edition and 64bits edition, so making it 64 compatible now, will made sure all 64 users can run it, now and in the future...
