O.K Update. I realized that the USB cable works. It works only with the laptop, but that is fine. So now I don't have to buy another cable.

Now, I connected the Desktop through LAN to the Modem(modem and router are the same thing right?), and the Laptop through the USB to the modem. It did not work, and the Win XP on the laptop still reports that the local connection has limited or no connectivity. I even enabled the peer to peer connecting in win XP, but it did not help.

The LAN server hosted on laptop still shows in the game, but it is not possible to join.

So I tried this with different game, Serious Sam(yes I know none of you have ever played this game) in there the server shows up too, but when I try to connect, after some time of connecting, it says unable to find the server.

I am going to try one more thing. I will somehow attempt to assign IP addresses to each of the computers, and then see what happens.

And as fo your question, I am attempting to connect 2 computers through LAN
