I don't have any of my C++ programming books anymore, and I forgot what the % operator stands for. If you can tell me that, I may be able to figure it out.

EDIT: Nevermind, I remember now. the % operator is a modulus. Example: int rem = 4 % 3;

Of course you probobly already know that...lol. I will further try to figure this out.

What are your thoughts on this so far?
