138 degrees is that for CPU or VGA? Which one it is wouldn't really matter I can tell you though for both it's not good and it might be done real soon with the component.

CPU should be between 30-70
VGA can get some more 90C is not strange

Also AMD Atlhon XP2400's don't have the built in thermal protection like p4's/AMD64's. So if its overheating it will just continue.
