Ok for some random reason I decide to touch my video card one day when my computer case was open and when i did i discovered that it was really hot.like i mean hot if u were to hold ure hand there for like 2.5 seconds it would burn your hand.Is this something that i should be worried about, like will is eventually stop working or is it normal for it to get really hot?

I might have been over exaggerating on the buring your hand part but i believe it can burn you maybe in 4-6 seconds I dont kno but it is very hot.

Should i start looking for another video card?
