True, but we don't really know what kind of effects it could have, do we?. What I was trying to say is that it's important to have large countries such as US help discover the effects. If they prove to be nothing, it's all well. If the effects are found to be disastrous, e.g. global floods, storms or complete lack of food in many areas around the world, then at least we might be able to prepare.

I have no clue at all about this stuff, I don't know what kind of effects a 1-degree increase in climate could cause (I don't have time to read Warranto's links), but that's my point of view nevertheless.
