I have a huge problem with rengaurd. I have been, until about a year ago been using rengaurd. Then it was uninstalled. Kinda. Now, when i run the setup, it says "Cannot be modified" if i select the "Repair" or "Modify" options. If i select "Remove" it seems to work fine. But then it's the same as before. I have tried removing rengaurd from the control panels "add and remove" function, nothing happens. I click remove and nothing goes.

If anyone can help me out, I'd really appreciate it. And sorry in advance if this is something thats been covered before.
