no offense taken, I'm not exactly "pro" with hardware, But my room is cold (Because I'm in a loft) with no radiator. Lol.

So when I wake up my room is as cold as the North Pole. Even my keyboard is freezing cold.

My graphics control center (ATi catalyst control) Tell's me my graphics card is constantly 0o So there's most probably something wrong there.

But this graphics card is fairly new, Only got it a few week's ago.. Okay maybe a month.
