Dave Anderson wrote on Tue, 23 January 2007 23:53I suggest you take a look inside your computer tower and make sure all your hardware is plugged in all the way and that your video card, RAM, and any other card peripherals are seated in the buses correctly.

Other than that, I just suggest you keep an eye on your hardware temperatures and anything else that may be suspicious to the problem.

One last thing, make sure you have enough power to power all your hardware and that your PSU has reliable voltage ratings. Check into your video card and see what the minimum voltage requirements are and check to make sure your PSU is up to the challenge.

Okay you lost me at PSU. Lol

When i have some sleep, I'll check tomorrow, Also I think it's time I cleaned my fans.
