Viking wrote on Wed, 21 February 2007 20:18I have no dust as I built the computer only a month or so ago. I have 2 120MM fans at full speed, the case has 2 temperature sensors and they never read above 30 in Celsiuses. Also my CPU fan runs fine and the video card has a fan on it that runs good to. The office is a cool place because the heating for out house dos not come to this room. I usually wear a jacket well playing but its not cold as a refrigerator usually 60 in Fahrenheit.

Generally when stuff works fine then starts slowing down as you described in your first post, it's a sign of overheating, but as you describe there, overheating doesn't seem to be the problem.

Does this problem happen just on Renegade, or other games too? Have you tried playing Renegade for 5-10 minutes, quitting, then checking the temperature of both your computer and gfx card temp?
Perhaps it's an incompatibility problem with the parts in your computer.
