WOL detects the: 'Highest available bandwidth in a specified time'
But often fails (I once get a 100MB con with my 56k)
The best way if your using Broadband sett your speed manually to ISDN (or whatever it is called in the settings screen)
Thats enough for good gameplay and it seems the game running much smoother with this setting on broadband because you have a 'reserve'.

If you play Rengade and have Problems with pings and such, disable all IRC and IM (e.g. Aim/ICQ/MSN/YIM) sessions and be sure that no Filesharing Program or such is running, because this programs often try to grab all possible Bandwidth.

Just some tips.
