The entire system of how a car works should be tossed. We need to step into the future. Almost all new cars now have GPS systems in them.

They know what street they are on and can find the best way to get from place to place.

-All roads need to have magnetic grips on them. Cars travel on these grips which eliminate cars driving off road and into trees and such. Through this magnetic interaction, information and data should be transferred back and forth and allow cars to find the best route, and least crowded route to get to a destination ON ITS OWN.

-Steering wheels should be replaced with something similar to what aircraft use to steer. They should only be used for manual drive. Most of the time however, cars will be automatically driven.

-Since they would all be bound to set tracks, car accidents will happen little to never, and such traffic will never be a problem. Also speed, it will be much faster because people don't need to worry about going too fast and hitting another car, as it is all averaged out.

-Police will be able to shut down or control cars their are pursuing from a distance.

-All intersections and road crossings should be avoided by a simple underground pass. Sidewalks keep going forward, as roads drive underneath them. Same with intersections. One road is level, while the other either goes above or below the other. (With side ramps to merge them together)

-Also with the magnetic pull of the tracks, gas wouldn't be required (Not a lot anyway) because cars would be pulled magnetically to their destinations.
