To edit the boot menu of Linux, look for a text file in:

`/boot/grub/menu.lst`

run this command:

`vi /boot/grub/menu.lst`

Have a play about (its pretty straight forward), making sure you ABSOLUTLY BACKUP the original somewhere and then restore it if you break it.

BTW, I managed to get renegade working on Ubuntu 7.0.4 and improved the FPS by tweaking vsync in `/etc/xorg.conf`.

Still cant get rengaurd working though, I get error 000008 using wine.
