The intro C++ class I took my first semester was designed for people who had NO programming experience. I went in only knowing how to program a TI-83 calculator, a programming language no where near as complex as C++, but I still found it to be incredibly easy. (would have gotten a solid A if I hadn't bombed the final. 32's hurt.)

If you get into the Computer Science program, chances are one of your first classes will be an intro programming class with C++. So knowing that, don't do any more than buying a $20 or less book if you want a jump on the class.

Also, I agree with everyone else.
Stop focusing on how much money you will make. Do not set your goals based on how much you wanna make. If I did that, I'd never reach my goal seeing as I wanna be a billionaire. (who wouldn't?)

Especially today with everything switching over to computers and new computer technology coming out like improved AI for example, programmers and computer engineers will always be in demand, therefore, you will end up getting some good amount of money (assuming you make it through the whole degree program and get hired).
