To keep your old serial copy the hashed registry key to a file and copy the WOLdata.key file from your renegade/Data directory. Then replace the hashed serial in your registry after installation and overwrite the the WOLdata.key file with the one you backed up.
EDIT: DON'T uninstall just in case this doesn't work. Instead rename your current ren directory and re-install. Don't just install to a different directory-name as several keys are placed around the registry that you'll have to replace that denote the renegade install path.
