Dantethe server currently would require the following to work right...

a. Win32 based
b. MS SQL MSDE 2000 or Standard MS SQL 2000
c. .Net framework (easy one)
d. 4 ports open for private use
e. a bit of sql knowledge (if you gonna have a server, j00 gotta know how to run it)
f. at least a P3, 256m computer
g. an edit to the hosts file (if you don't know what it is, i can't tell you)

simply put, this redirects the servserv to your own computer, then will tell the fds to send all ladder queries to your computer, then they will be caught by the console application that runs (Ren Lad Kit software) and then uploaded to the DB (shared if desired). Now, the tricky part comes when displaying the data, you will have to build your own stuff for that, as i don't have time to develop a ladder site for you. but with some simple db knowledge, you can create a quick site for it in a matter of no time, if not, there are plenty of people that could help you out with it.

I have a Dedicated Server (Windows 2k Server, 2.4Ghz, 512 RAM) with 700GB of bandwith.
