Goztow wrote on Tue, 16 December 2008 10:26TBH: if you say that whoever plays around with bypasses will get their Renegade serial banned off xwis, that would already be a good signal to some people.

Or better: create an unique TT hash, based on a combination of variables and ban that. Then people would need to change their hardware / OS / ... to get unbanned.

YaRR bans something that only changes when you change your isp, though this way does have one problem, if someone were to live on the same street with the same isp they would be banned(this is very unlikely to happen) here's a link:

To me this system works pretty well.

Changing hardware for some people would not be that big of a hassle, changing the isp on the other hand can be a big hassle.
