Core 2 Duo E8600 @4.5GHz
ASUS Maximus Formula motherboard
4GB DDR2 RAM
GeForce 8800GT 512MB
~2TB of HDD space (4HDDs)
Windows XP Home SP3/Windows 7 Beta (x64)

Renegade barely drops below a constant 100FPS, even in the largest servers (if it does, which is rare, the lowest I've seen is ~80), at 1600x1200 with full AA, full AF, supersampling transparency AA, and shaders. I sort of need a new video card (not really, but it's what needs balanced the most), and am awaiting the GTX3x0 or HD58x0 cards for that. Otherwise, nothing short of the GTX260/HD4870 would be worth it, as this one still does really good.

A current backup system/internet machine (sold the better backup, gave another away, and yet another is in parts, hence the low specifications of it) is as follows. This is the first system I played ever Renegade on. I'm surprised now that I used to all of the time. It's rather unplayable (due to the CPU), especially on large or even medium servers, or maybe I just say that after being used to anything more.

Pentium III 933MHz
Dell Intel 815 based motherboard
384MB or 512MB SDRAM
GeForce4 Ti4200 64MB
60GB of HDD Space (2 HDDs)
Windows XP Home SP3/Windows 2000 Professional SP4

Internet speed is rated for ~25MB, but the televisions are a part of that. The internet itself is capped ~6Mb download, so I usually get that, minus a little, and between 768Kb-1Mb upload.
