which is why if you have an infinitely long tube and you jumped in you would travel forward in time, and the only way to create an infinitely long tube is to have both ends connect so if you have a doughnut shaped thing and you have magnets that would create an independent field from earth that went around in circles you could jump in and you would keep going faster and faster till the you be ripped apart or your craft would vaporize even in a vacuum, so what you would have to do is make a huge ring with tons of magnets forming an infinitely long tube that you are constantly falling down going faster and faster. so some time if you somehow find away to stop the effect of centrifugal force you can stop time in your little capsule when in reality and for anyone looking at the tube and you falling though it you'd be there for years just a blur but for you it would be 5 minutes or so
