I bet Roshambo can back me up on this since he told me once that just having a virus file is dangerous since some find ways of executing by themselves.That's because of a bug in the icon loading code probably; point is that the same thing can be done by ending malicious network packages. The downloader will not make the risk on a bug being exploited higher.. You'll need to write a specific exploit to a specific bug in either the downloader or any other Renegade code, which part you choose does not really matter much. It's not as easy as renaming virus.exe, just like it's not as easy as just sending the virus.exe over the renegade network connection. Tricky exploits are needed to make it execute.
