Make sure you close all other programs while playing renegade, and turn off as many back-round running programs as you can without fucking up your comp. I only have a integrated 23mb GF2, Athlon 1700, and 256mb ddr-ram, and I manage to get up to 60 fps in 32 player games by doing this.

back in the day, when i played renegade, people used to fear me as a sniper. I would sumtimes join the renbattle server and people would say "oh shit" and leave. I pissed me off how you could get 100+ kills in games, and would never get any credit, I always thought there should be a seperate title(seperate from mvp) for the person who got the most kills.
