Yeah a lot of people in our outfit in Planetside have been saying that 256MB of RAM is whats slowing them down. I had 768MB when i played planetside for the first time and it seems to run fine with it. I have a GeForce 4 Ti 4200 (305Mhz/650Mhz) and It runs fune on default settings. You should get at least another 256MB but getting a 512MB DIMM is better and the prices are so low now it worth having the 512 MB anyway.
