It really depends on what resolution you are running.
And what quality you want. (I'm guessing high end)

Yet to say most of the carts posted are awesome but it mostly all depends on what kind of basis system you are running.
Example does your motherboard have pci-E 2.0 or what is your CPU?

Since I'm guessing you aren't buying a full new pc. And it would be a waste to buy a new high-end cart and then to notice you can't use it to it's full potention.

Also about directX 11 as far as I'm aware you would need an Ati cart for that. Since Nvidia currently is stuck at 10.
Also most of the Ati 4000 series can run Directx11 just fine especially the main feature of directx11 (teselation).

Just post your basic specs. (Like Cpu/motherboard)
Since it really would be a waste to buy a very new videocard if your system can't use it to its full potention.
