It's a very easy thing to do; when you're all set up and your PC runs fine, it's just a matter of going into the BIOS and ticking a number up one or two points. No voltage change, nada. It's easy to find help on how to do so, or even I could probably list the process.

As for the RAM, it may be on the list for the motherboard, but you may still need to change the timings and speed in your BIOS in order to maximize the performance. It may just default to 1066MHz. Once again, it's very easy to do in the BIOS or in AMD Overdrive.

To be honest, I wouldn't worry about that stuff until you've got your PC working, and you've used it for a while.

I plan on buying the 3 parts I am just about 50 bucks short which im trying to come up with
