And remember that you get what you pay for... cheap stuff might seem like a good idea at first but it often has astonishingly bad performance.

I bought a higher mid-range WiFi-G PCI card nearly 10 years ago and it still manages to maintain excellent signal strength and throughput. Been using it to connect my main gaming rig to the internet since I bought it and never had any lag issues. At this point it's easily the oldest component in my build and I am probably going to keep using it until they stop putting PCI slots on motherboards and go PCIe only.
