My recommendation would be GearHost. In a nutshell you get a shared site on a cloud network that is blazing fast (I have many production software running on this and its great), MySQL+MSSQL databases, SmarterEmail+SmarterStats (both really nice software), Asp.NET (up to 4.0 AND FullTrust <--- Big Deal), remote IIS management, and more.

The downsides is they do not offer DNS management at the moment, so you must use your own provided by your domain registrar. If you want to know more hit me up, or just hitup GearHost.

Oh, and its like $9.99/month+$1 for stats($10.99). They also offer Cloud Servers (virtual dedicated on cloud network) at $99/month.
