Why would it prevent playing on other servers?

If I understand you correctly, you should make a .mix package with the files you want in it (using XCC mixer for example) and then convert the .mix to a TT package (you can remove the .mix after that).

If that does not do what you want, please explain what you are trying more carefully, I'm getting a bit confused. Maybe you can explain exactly what files/changes you are doing, and what does not work as expected or what part you cannot figure out.
