ok , has far as this talk of black holes, including your down load Ender . your thinking of black holes as having a huge mass at the center of it . but, what about the type of black hole that Dr. Sten Odenwald talked about, there isn't a huge mass at the center that you would be pulled to and become part of.

although he does say that it has an "exotic geometry where time and space switch their roles" . so im wondering what happens to solid matter that is pulled in to this type of black hole , and staying on the track of "space and time travel" i think this type of black hole would be the one that would have a chance of fulfilling that quest. or a modified version of it.

im trying to find out more about this type of black hole....
