you don't need to have to do that. a few years ago i learned that they grew a human ear on the back of a mouse...all you would have to do is surgically remove it from the mouse and implant it. but i am sure that technology has moved forward in that and if my memory serves me right...i think i heard that you can just grow organs w/o a human donor/sacrifice. i am not 100% sure on that.

testing the side effects...that is worse than animal testing. these are human beings...you or me. i mean...yeah...they're clones...but still. you could argue that for medical purposes, every parent of twins should have to or have the choice of giving up one of the babies for testing. think about it...giving up one of your own children for testing purposes. You could also argue that you're giving up one of ur children, but for bettering your community and the world around you. but what if it doesn't? you just gave the life of your child away or severely diminished the possibility of your child living a normal life. what if your parents did that to you? who knows what kind of side effects these things have...it's just too dangerous.
