Hi,
Since I D/L RenGuard I have found that the standard key that I always bind to "Crouch" the "F" key does not work when you are flying. You do indeed crouch when not in a vehicle but it does NOT make the Orca go down any more.

The FIX that I used was to enter "F" in the SECOND Column for controls so "F" is selected in both columns for "crouch". This solves the problem and "F" works for crouching AND will make a flying vehicle go down.

My other basic keystrokes are:

D - Left
F - Crouch
G - Right
S - Alt Fire
A - Use
R - Reload

Mouse middle button for forwards.
Mouse right button for backwards
Mouse left button for fire
Wheelup - Zoom in sniper mode (NOT to change weapons)
Wheeldown - Zoomout in Sniper mode

And yes I use 2 mice, a PS2 3 button logitech trackman marble for normal and a USB trackman marble wheel mouse for when I am sniping

There are other keys bound but they are the standard settings
and ihave the latest Logitech drivers.
