You want allow your visitors to Upload screens/files to your site?
You want an easy way to upload screenshots/files to your webspace without conecting every time to your FTP?
You want to upload files/images to your space from everywhere in the world??

Than this skript I wrote is your choice it that allows to upload images and files.
After every Upload a link of the uploaded file is provided also an IMG tag for inserting into bords.
At the mainpage there is a preview of all uploaded images if you click on them the orgial images is showed, uploaded nonimagefiles files are marked as nonimagefiles and a downloadlink for the file is showed.
You can select between save mode (that means only the Admin can upload files) or normal mode (everybody can upload files).
The Admin can also delete uploaded files.
You can also setup:
* maximum size for Upload (KB)
* with of the Admin previe Images
* with of the previews at the main page

You can view an example at: www.imageupload.de.vu
(on some times the server is slow, but I ahve no better host for that)

You need only an PHP supporting webspace, no database is needed!

You can download the script here
