The way Pay Check explained itself, it should not work, at lest you shouldn't be able to see into the future, much less navigate around it. Any yes, because if you think about it, all things will happen at certain times due to certain things. This remains true with things that don't come in contact with living organisms, that is were it becomes tricky. If we had to technology and fast enough computers, we could scan every molecule in a section of universe, then we would be able to predict everything perfectly that would go on in that section, if not for something from outside the section disturbing it. With living things, we would need to understand completely how the mind works, if we could, we could map out the future like you could with that section of space. This could be confusing, you might ask, what if some one makes a different decision, well that's covered too, the thing that made the person change their decision would also be mapped out, so the machine would know that the person would change their decision. By knowing everything about the person, you can tell exactly how they will react. This method would probably never work, as you would never be able to see the future as every time you saw it it would change.
