Go get Spybot S&D and AD-Ware 6.0. (Search on google) Update them both , then scan your comp and remove anything they find. If you have browser windows that shoulnt appear or browser tool bars at the top that should be there go get CWShredder and hi-jackthis (Again Search on google) and scan with those. If you dont know what your doing.. Go ahead and go here and read.

Thast should fix all speed problems. As long as you maitains it and scan often you should have a good 56k connection. My 56k hits 120-170 ping while playing renegade. I also have cable though so if that doesnt work... get cable.
