Ohkey...some days ago Renegade started crashing 10 seconds after I joined a game, so I reinstalled it like 6 times before it finally worked.

I played some hours and then all the sudden it crashed again. Not lag-out, not banned or kicked. The game just freeze and I return to the desktop leaving the Renguard window open. It happens with and withotu Renguard btw.

Anyone seen something like this before? I thought it was my graphicscard going hot cuz the first time I crashed it was pretty hot in there, but I played 2 hours of Far Cry without noticing anything

Any ideas?

The PC is formatted 3 days ago and all is fresh
