Jeez... what a mess...

I have had to constantly reinstall renguard and the renegade just to get it working, it has messed with my pc, windows, modem, router....

Reinstall everything and get the newest renguard

Then hows about only playing on RG protected servers, then there's no argument. How can you cheat on a no-cheat server?

As an aside, on other games I have found sometimes I die a little too quickly, like I get shot once by an engineer... I have tested this and I can't do it..
