OOOOh, about that sound.dll thing or whatever, is that going to fix Renegade's issue with Sound Blaster Audigy cards?  I tend to have sounds "repeat" and "stutter" like a broken record in game, but I never bothered to read up as to why this happened.  Updated drivers didn't help, so....

I woudl think that would be an issue with the windows driver, but maybe it will fix your problem, only way to tell is to try I guess

Well, I tried different drivers and I haven't found a solution.  I'm sure someone else here uses a Sound Blaster Audigy card....

No YSLMuffins. You are the only known human on earth that uses Sound Blaster Audigy. So, good luck.

Well, your response is why I never bothered to post a topic on this.  I guess there is nothing I can do about it until the core patch arrives.

YSLMuffins, I just did a google search for "Audigy Stutter" and saw lots of potentially helpful links, at least definitely other people are having similar problems.

Thanks Blazer

Unfortunately, I haven't found anything that really pertains to Renegade.  This doesn't happen in any other game, nor in the windows environment.  I've found stuff in which people have stuttering sounds all the time, and at random intervals, but not during a game. :-\

It's all right by me though, I can live with the occasional stuttering sounds.  It only seems to happen when I rotate the camera (sound restarts and then abruptly cuts off), probably because the sound is moving from one speaker to another (I have a 4.1 setup).  There are other times though, when the sound really stutters, as in P-P-P-p-p-p-p-p-p-p-p-p-p-ow!  But it's only occasional.

Anyway, I just brought this up since BHS mentioned an enhancement to the sound system.    I can live with it, I just hope the enhancement doesn't make things worse...

I have an Audigy Gamer, and I've had no problems with it. HOWEVER, a friend of mine uses the same card, and he got the "p-p-p-p-p-p-p-pow" you're talking about. I don't know why... Perhaps you should try changing which driver Renegade uses.

MrBob{DG}StryderNo YSLMuffins. You are the only known human on earth that uses Sound Blaster Audigy. So, good luck.

I have an Audigy. I've had no problems with sound on Renegade.

Could you tell me what driver version you use?  And what driver you use in Renegade?

PS. Sorry for hijacking the topic. :-\ :oops:

I read something on this, I think there's a temporary fix but it might just've been for a problem with Renegade using the wrong audio driver-thing (like miles fast 2D positional, EAX creative labs 3D, etc..). I would check if Renegade is using the right one of those as you've configured in your sound card control panel. Maybe the stuttering would stop if you used a different one.

I understand the Renegade part, but I'm not sure why I have so many.  Back when I had an ESS Solo card I just had one choice to use as an audio driver, now I have several with this Audigy card within Renegade.  But in the control panel, I only have one.  Where in Control Panel exactly do you mean?  Under Sound and Audio Devices (I'm running Windows XP)?  There, I only have one choice: SB Audigy Audio [C480]

What I mean is, if you open up that panel (  SB Audigy Audio [C480]  ) and choose a different audio type, the stuttering might stop. Or alternatively choose a different one in Renegade its-self.

http://www.n00bstories.com/image.fetch.php?id=1052430087

What I mean is if your sound card lets you use a range of those types like the one I have listed then using another one might fix the stuttering.

You can choose a different driver with the Renegade configuration tool. (wwconfig.exe)

This might be a crazy suggestion, but if youre sound card is in the top slots, right below your AGP video card, or in a slot beside a PCI video card.. try moving it to the bottom (assuming you have more) and rebooting the computer..

Depending on your mainboard and bios, it "should" assign it a completely different memory space..

I have had numerous problems in the past, especially with Asus and Intel mainboards, where PCI slots 1-2 didn't like to play nice with each other, or the AGP port.

Try this: When the computer starts up, press DEL to enter BIOS setup. Look for setting PCI
Latency and set it to 0.

{DG}Stryderlol, wow.   I was joking O_o  :rolleyes:

I know.   Sorry I didn't find it so funny at the time however.

Thanks everyone, I am going to try all of your suggestions in the order posted...

I've had that problem

But I found that if I left my Bass and Treble at the defaults (50%) that I wouldn't get the problem. Also, most likely on the back of your subwoofer look for a switch that has most likely 2 channel and 4 channel, switch it to 2 and see if that helps.
