I remember I have had this problem before with my server and I fixed it but it wont work this time.

Whenever I try to start the FDS tool it starts up, logs on but then no matter what it wont create the gaming channel. I have logged onto WOL with my other computer and the FDS tool is logging onto WOL right the channel just either wont show up or can't be created.

The last time this happened I simply used the repair function on the unistaller and it started working again. Now I have tried that several times and I have totally wiped my server folder but it wont work. The mods on the server are:

scripts.dll ~ dragonade and scripts 1.93 I think it is. Neither help.
scripts2.dll ~ original scripts.dll
bhs.dll ~ self explanitory

Then with dragonade I have tried putting in objects.DDB but it wont rename itself to bjects.DDB like its suppose to(I think atleast). I tried manually changing it but it didn't work either.

Anyone have any ideas?

Turn off "quick match", this sometimes gives problems with the FDS.

Is the server passworded? If yes:
- It should be EIGHT letters/numbers long
- The password CANNOT start with a number
