[View Forum Message](#) <> [Reply to Message](#)

My current computer has a bad motherboard...when it heats up, my computer simply powers off (yes I made sure it wasn't the thermal protect in the BIOS or the CPU overheating).

Anyhow I decided to bite the bullet and upgrade. I'm taking a week of forced vacation time next week (reached max limit of PTO hour), and I want to play some damn games

Heres the stats of my current system:

AMD Athlon64 3000+/2.01Ghz

3GB RAM

BFG Tech GeForce 6600GT OC 256MB AGP 8X

MSI K8N Motherboard

Soundblaser Live! X-Gamer 5.1

NEC 3500AG external DVR+-RW burner, USB 2.0

Adaptec 29320 Ultra320 SCSI adapter

Seagate Ultra320 15k rpm 73GB SCSI hard disk x 3

And here is what I have on the way:

* Intel® Core 2 Duo E6400 Conroe Processor 2.13GHz, 1066FSB, LGA775

This puppy is faster out of the box than anything AMD has to offer currently (even the FX-62), and it easily overclocks to 3Ghz+ even with the factory cooling fan, which will do me quite well.

* Corsair TWIN2X2048-6400C4 2GB Kit DDR2-800 XMS2-6400 Xtreme Performance Memory

* BFG GeForce 7900 GTX PCI Express 512MB GDDR3 Video Card w/2 Dual-Link DVI-I & HDTV

I like BFG products because they have a lifetime warranty and excellent tech support.

* Asus P5W DH Deluxe 975X 1066FSB LGA775 DDR ATX Motherboard w/Audio, Dual Gigabit LAN, RAID/Serial ATA

This board was so expensive it was annoying. But from my research it is one of the best overclock-friendly boards, and I definitely plan to overclock, so it costing a bit more is worth it, if I can OC my CPU to a faster speed than one that would have cost me \$600 more.

* Coolermaster STC-T01-UBK CM Stacker Aluminum Full Tower Case (Blue)

I got one of these cases for Crimson and I really liked it. Very good airflow and has leet blue LEDs

* OCZ OCZ700GXSSLI GameXStream 700W Power Supply
My SCSI drives eat a lot of power, as will the graphics card.

* Memorex / 16x4x16x DVD+-RW / 48x24x48x CD-RW / 4x DVD+R DL / Black Internal DVD Burner

The main reason I choose this was because its the only black internal DVD-RW I could find that had blue LEDs.

I will be re-using my SCSI drives-there's nothing faster except solid state disk. I do also have a 250GB SATA drive that I use for random storage. I have a huge external RAID NAS so having lots of disk space inside my PC is not a concern, I mainly want the OS and primary data drives to be as fast as possible. I will most probably re-use my SB Live! instead of using the onboard audio, since onboard audio drivers sap a wee bit of CPU...then again, I will have dual core so will it really matter?

I built this system with "bang for the buck" in mind. The only item I really splurged on was the motherboard, since I can always plop faster and faster core2-duo CPU's into it, and its SLI/crossfire ready, but I doubt I will ever justify spending over \$1000 on video cards, unless the game actually induces orgasms everytime you breach 200fps

This will be sort of a sad event for me, as it is the FIRST time I have ever built a personal system that does not have an AMD processor, and I have had many many systems over the years, with my first "IBM Compatible" PC being an AMD 386-40Mhz, which even then owned Intel (who only had 386-33Mhz). I have been a solid AMD fan all these years, but this time Intel has the best CPU, as far as performance and power usage goes. I won't be surprised at all if AMD pulls something out in the not too distant future that puts them on top again, but for now Conroe and Woodcrest are king.

Hopefully I will get to build this during my "vacation" time, I will try and post some pics.

Very impressive. That's close to the rig I need to upgrade to (excluding PSU & case) when the next generation games start flowing in, my current setup is getting a bit old (XP 3000+, 6800 GT, 1.5Gb DDR400. Sure, the only real issue is the CPU, but upgrading it means upgrading everything else :/)

Looks like Core 2 Duo is getting a very strong foothold on the future CPU markets, despite AMD's price drops.

06:50<http://www.xtremesystems.org/forums/showthread.php?t=58642>i don't think a dual core processor will improve on gaming performance. instead try to get the processor to run as fast as possible.

1. Nobody actually runs liquid nitrogen cooled gaming machines, and there are already benchmarks of conroes at over 5Ghz
 2. A dual processor machine will improve MY gaming performance for several reasons:
 - * I can run FRAPS to record my gaming and not lose any FPS
 - * I use the firefox "showcase" plugin to display 4+ tiles browsers simultaneously on my second monitor (mostly work stuff). When they all refresh at once, I take a CPU hit and my games lag. With 2 procs I can assign showcase to the second proc and it won't affect my game.
 3. I DO intend to run my processor as fast as possible, which is, as I explained, why I paid extra money for an overclock-friendly motherboard.

Well the beauty of it is it was "free". I did some work on the side and will be using that money to pay for it. I usually dont like to buy things for myself unless I have money to "spare". The real clincher was that since I have to take a week off of work, I want to play some damn games during that time, and my current computer is hosed. That, and heck, "you only live once"

Honestly there is no real benefit from having quad core on a typical desktop or gaming system. Sure, if you are encoding video while burning dvds while rendering some 3d model and playing a game all at once then perhaps...but that's hardly typical.

Quad cores primary market is for servers or high-end graphics workstations. I'm sure that won't stop some gamer with rich parents from buying one just for bragging rights though.

I'm not into overclocking actually. Okay, so I unlocked 4 pipelines on my Geforce 6800, big deal, but besides that I don't really like to mess with my hardware that much. The Core 2 Duo E6600 will surely help me tremendously just by itself. I mostly need its power for video encoding and post-production. But of course I do love playing games. So for me, it's definitely a winner.

DreamWraith wrote on Fri, 18 August 2006 13:06 Should have thrown in a low end water cooling solution such as a Thermaltake BigWater!

Or some type of cooling system suitable for overclocking. The Intel cores run hot to begin with. Plus, it's just a sin to overclock anything with stock cooling. I personally would take the heat-sink off the chip-set, clean it and reset it with arctic silver. You would be surprised how shitty some of the factory work can be on setting heat-sinks. This may be necessary with the video card too. If you plan on overclocking that as well. If you know someone in the marble and granite business, kitchen counter-tops and such. They usually have acetone needed for cleaning the surfaces. Is this going to be a 64 bit Vista or Linux box? Most likely a XP Pro with dual boot and a virtual machine.

Subject: Re: My new computer
Posted by [Renx](#) on Thu, 24 Aug 2006 04:46:41 GMT
[View Forum Message](#) <> [Reply to Message](#)

Conroes don't run hot.

Subject: Re: My new computer
Posted by [Blazer](#) on Thu, 24 Aug 2006 06:26:27 GMT
[View Forum Message](#) <> [Reply to Message](#)

As RenX said, Conroes do not run hot, which is the reason you can overclock the E6400 to over 3Ghz with the stock cpu cooler. Conroes use way less power than AMD and other Intel

processors.

That being said, I still got the ASUS "Silent Stack" cooler, just to make sure I have no problems. Even with the coin in the picture for reference, the photo still does not truly reflect just how huge that cooler is...holding it in your hand it's like holding a loaf of bread or a pineapple.

Subject: Re: My new computer
Posted by [icedog90](#) on Thu, 24 Aug 2006 06:27:39 GMT

Intel FTW...

Nice PC... why, oh, why do we have to have QUAD core processors? That's getting beyond a joke... So, by 2020, we'll be using 1024 Bit, 32 Cored processors rofl

Subject: Re: My new computer
Posted by [icedog90](#) on Fri, 25 Aug 2006 19:20:36 GMT
[View Forum Message](#) <> [Reply to Message](#)

Intel's quad-core is going to suck, because it doesn't actually have 4 cores. It's basically a dual dual-core on one chip. AMD, on the other hand, is going to have a quad-core that actually has 4 cores on one silicon. Unfortunately, that's not going to be until around late 2007 or 2008.

Subject: Re: My new computer
Posted by [Renx](#) on Fri, 25 Aug 2006 19:56:43 GMT
[View Forum Message](#) <> [Reply to Message](#)

AMD will also have a dual die quad core chips, it's codenamed Deerhound and may be out late 2006. It will just be two 65nm X2s stuck together, much like Intel's offering.

K8L will be the native quad core and won't come out until probably 2H 2007. Intel will no doubt have a native quad core by then as well.

The main concern about Kentsfield was always the FSB and it being bandwidth starved.

You can say that about dual core too.

Dual core is actually fairly useful, since you can do something like play a game, and simultaneously run FRAPS to record a game video, with no loss of FPS. With a quad core, you could do that and also...run Seti@home, and also render a 3D landscape all at once! Really...how likely is it that the average person is going to be doing something like that

Renx wrote on Thu, 24 August 2006 11:04I would get a couple 120mm Vantec Stealths for your case too if you like silent fans. They're very quiet and move a lot of air. With a fanless heatsink like that you're going to need great airflow for doing things at continuous full load.

It's not fanless...it has a fan sandwiched in the middle. Here's a pic of it while it's powered on, taken directly from the side.

EDIT: Forgot to mention that my case also has a huge 5" silent fan in the rear, a fan in the top, and a fan in the side. That combined with the bottom and front being mesh, I would dare say this is one of the most ventilated cases you could have.

EDIT2: I stuck a crappy 1MB PCI Trident video card in tonight, just so that I could boot the system and install all the motherboard drivers etc. Besides the shitty video, the system is very nice and fast. I also updated MBM (Motherboard Monitor) to my new board and was pleased to see the temperature of the CPU is literally 30F cooler than my AMD 3000+ was (under load too, with WCG running and maxing out both cores), and the case temp is equally low. So I'm quite pleased so far with the thermal efficiency of the case and CPU cooler.

With something that pretty does it really matter how efficient it is? I knew this would happen. I had some audio from a video game developers conference a year or more back. I swear I didn't recognize the speakers name and can't remember his resume, but I do recall it was an impressive one. I don't think he was there for the money. What stood out to me in his speech was an overall theme to run for the hills. He made the dual core sound much like dual channel memory, with signals going in different directions and arriving at various times. As game developers (I guess all developers) want the signal there. It obviously has to travel, so the next best thing is to get them in a timely manner and in order. Basically dual cores blow this all to hell, and quad cores even worst. I added the quad core part myself. After years of processor design and gaming development I think I'm qualified to do that.
Looks good so far, keeping it cool.

Blazer wrote on Thu, 24 August 2006 02:26As RenX said, Conroes do not run hot, which is the reason you can overclock the E6400 to over 3Ghz with the stock cpu cooler. Conroes use way less power than AMD and other Intel processors.

That being said, I still got the ASUS "Silent Stack" cooler, just to make sure I have no problems Even with the coin in the picture for reference, the photo still does not truly reflect just how huge that cooler is...holding it in your hand it like holding a loaf of bread or a pineapple.

Do you got to be careful when you move your case around with that HS? I heard stories of HS like that ripping the cpu out of the mobo because they're so heavy. By the way while no X-Fi?? I have one and it's the best soundcard I ever heard, plus no crackling problems like their previous SB brands.

BFG lost my video card so they replaced it with their most expensive model, the 7950-GX2. It does have some drawbacks for me though, since I use dual monitors, and when you are in SLI mode you can only use one monitor. The driver lets you switch between modes though so now I run dual monitors when Im semi-working or for playing Renegade (I get 100+ FPS in renegade even only using one GPU). For Battlefield2 I can go SLI and get 120FPS with max detail

Great because i'm getting two of them, but will both of them SLI'ed together support four monitors?

Subject: Re: My new computer

AMD are mostly concentrating in getting ONE core proccessors as fast as possible for gaming computers. on the other hand they are also making multicore proccessors for people like me that like to do a million things at a time.

if you live in england and have seen a pc-world advert you will here them say "Dual Core, so you can do 2 things at a time like burn a cd while watching a movie" well you can do that with a single core proccessor, so why do they say it? is it to impress all of the dumbasses that already own a single core computer that can already do that? i don't see why people don't see the logic in this stupid advertizing, i mean, most of the people on this forum could see though that.

im blabering off topic here, but you ever heard of "AOL"? well they seem to think that "wireless broadband" is actully real, how? not at the moment anyway, you can't get a wireless signal from a ISP, so why do they say that? also that seem to think that the broadband going to a router that supports WiFi is anydiffernt from a router that doesn't. if you hear their addverts on tv they say "Wireless boardband, now the same price a regular broadband".

one other thing with AOL is that if you get dial-up(years ago, but still active) they want you to install their software that include "antivirus(no better that norton), parental controll, and a firewall(again no better than norton)" and the whole thing is so resource hungry that you cannot surf with it!

i have said this before but when you buy a computer (from a commercial company) everything else is comprimised by the \$10 motherboard my advive is to ask someone to build it for you. it works out cheeper and faster, and will last longer. my "know-how" on computer is fairly limited but i know how to build one and it is pretty easy, someone that watched me do it once went and did it themselves no problem.

PC-World are for people that can't tell a Mouse from a Keyboard, they use "big, fancy" words like that just to impress people and make more money.

Their technical support is the worst i have experienced... but it's a good place to buy routers and misc cables from etc.

At E3 they had Alan Wake running flawlessly on a quad-core setup, and according to the developers, the game was completely built around a multi-threaded environment. Infact the development team said that once the game is released, you'll need at least dual-core processor to run the game on medium quality settings.

Check out the Alan Wake demo, it looks brilliant.

That is The Inquirer, they make stuff up on the spot. I'm a professional games developer, I know the advantages that can be obtained with application of four cores. It's not hard to design an engine to cope with this, it just takes planning and thorough designing.

Holy storage batman! You got an apple xraid attached or something?

Hows the 7950GX2 doing in vista? They are supposed to be releasing a driver that lets you run dual monitors in SLI mode (and switch between SLI/non-SLI without rebooting).

Subject: Re: My new computer
Posted by [djlaptop](#) on Tue, 10 Oct 2006 23:40:06 GMT
[View Forum Message](#) <> [Reply to Message](#)

C: is a 500 GB drive.
D: is my old 400 GB drive from my old system
F: is a Maxtor OneTouch external 1TB Firewire drive.
H: is the other partition on the same drive as C: that I ghosted my system on.
R: is a redundant mirror of D:
X: is four 500 GB drives raided together.
Z: is two 500 GB drives raided together.

The 7950GX2 is rocking. Vista refused to install on builds prior to RC1 with it though - BSOD during install. I have no need for SLI mode on two monitors - I just like being able to have aim open on the right hand monitor while I play.

I have renegade maxed out to 1600x1200 and even on extremely large servers (50+ players) I am locked at 60fps (monitor refresh rate).

And yes, the DX10 cards are coming, but I needed to get this system up, and it'll be a while before anything comes out that takes advantage of DX10 (or anything that i'll play, anyway).

Blazer wrote on Fri, 25 August 2006 17:04I have zero desire for a quad core, and neither should anyone else who isnt doing graphics rendering or something like that. Quad cores are designed for servers, not gaming machines.

I play games with about a dozen or two programs in the background. Quad core processors are for me.

Not to mention that games can in fact make use of more than two cores

#1: working on current frame's physics

#2 (one step behind #1): working on current frame's graphics

#3: actively loading needed data, passively loading data that could be needed soon

any additional cores could work on AI processing (imagine having 16 cores... that'd give you some 12 cores for AI... most games can put about 16 bots per CPU with no decrease in framerate, so imagine games of 192 bots... lol)

an alternate setup would be to keep the physics core one step ahead of player processing, you could then have additional cores processing players' movements instead of AI movements... no more lag when you have 50+ people in the game. that is, unless your GPU sucks.
