hi, i see you are all really good with modding renegade so i need some help with a map im trying to make.

Like i merge and edit the renx file into renx and then put it into level edit, and when i load in the exterior of the buildings are in the right places, but all the interiors are all mixed together in 1 location.... Wat have i done wrong? am i using a bad set of models? if so can someone give me a link for the building meshes or wateva u have to put in renx.

Here is a screenshot of wat it looks like in leveledit:

Also i have attached the building renx file im using.... So if anyone has a better file or models or mesh or wateva or can offer any help as to y this is happening and how to fix it, it'd be greatly appreciated.

Try using the building interiors form the presets list in level editor (warning you will have to adjust their positions manually). There are two separate categories for these, one is in terrain and one is in tile try both and see which you like working with better.

You moved the proxies in Renx. You need to re-place the buildings on your map. There are little blue boxes within the buildings, these are the proxy bones. If you're going to move the whole buildings, they have to move with it.

The proxies tell level edit where to load the interior tiles.

They can be any color, just leave them alone and they'll have no problems with you and you'll have no problems with them.

You can also try selecting by name in gmax. They usually start with mg* for GDI and mn* for nod. So, mgbar for the GDI barracks and mnpwr for the Nod Power Plant. However, since you moved the proxies, you're better off merging the original buildings back onto your map from the building template gmax file.

Press H, you are looking for objects ending with a ~00. Those are the proxies.

Easy way to do this, step by step.

- Click on the selection Arrow (Button on top, looks like a normal arrow)
- Click and drag a dotted line box around all the parts of the building.
- Deselect all the things that were selected that weren't part of your building, things like the ground, or whatever. (hold Ctrl down, and click on each of the things you want to deselect.
- Delete the things you selected. (If you noticed something gone that you didn't want gone, just undo what you deleted, and deselect that, then delete again)
- Now, find the boxes for the interiors of the buildings. Select all of them, and then delete them too.
- Go to file, merge, and put in the buildings again. (if your not using the Multiplayer building template then only do ONE AT A TIME!)
- Select the parts of the building using the selection arrow. deselect things that aren't apart of your building.
- If the boxes in the buildings aren't grouped to the exterior of the building, then group them together, so you don't mess up later.
- What ever you do, DO NOT CENTER the building by manually putting in the coordinates, that centers all the parts of the building to where ever, and will screw the entire building's looks up,

just move it using the move tool.

-Place your buildings, and save your map! Your done!

Sorry that i replied to my reply, but the edit expirery ran out.

Ok it seems that no matter what template i use, if the map terrain is built using a height field the interior meshes tend to be in the one place.... But maps using the terrain in renx r fine... Y does this happen...

are you moving them in Level editor?

if so the proxys now move to 0,0,0 as they reset once you move the building.

place your buildings exactly where u want them in Ren-x using the xyz coords of where u want them to be in the heightmap.

you have them already.

They are called "Buildings-Setup.gmax" and "Flying_Buildings_setup.gmax"

this happens to me
its just because you need to move everyding together.
when you merge, as soon as you try and move the stuff it normally seperates. my advice, as soon as you merge it, group it.

i also reccomend you ungroup it at the end as its loads a lot quicker in leveledit without groups
