i've just read other posts and the wiki that say to take svkp off the black list and delete the old registry keys. i have a problem here. i'm using trend micro's pc-cillin, which does not allow me to type in the file i want to unblacklist. i have to add a whole folder. so i erased the reg keys, uninstalled renguard, and added the whole westwood folder to the "do not blacklist" box. its all i can do. i try starting up renegade and.... no. same problem. what folder(s) do i need to add to give svkp access? i dont even know which files are blacklisted, this is one of the worst and weakest anti-viruses i've used to date. i'd love to slit the developer's wrists right about now =\ this has been driving me insane for about 2 months until i finally remembered there was a renguard forum. picture below in .doc form.

Maybe you could change your virus scanner? There's 2 very nice free ones, AVG being one of them.
