i need to find a place in scripts.dll 2.92 that is only executed ONCE. for some reason, it is executed 3 times. i have tryed using global variables to stop it executing.

PINFO?

That's executed once per player, just make sure one player is in the server.

ID is also executed once.

im sorry i wasn't very specific.

when the server starts up, i need a place that i executed once. for some reason everwhere i try its executed 3 times. so i can initialize a program.

use a boolean variable to check if its run or not.

```
static bool hasStarted = false;
```

```
if ( !hasStarted )  
{  
    .....  
    hasStarted = true;  
}
```

since it is static you don't need to bother making it global.

i don't know what is happening but that didnt work.

this is really annoying, and i think tmp files is going to be the only answer.

scripts.dll is loaded once on server startup, then unloaded and reloaded when starting a game.

declare the static bool INSIDE the function, not outside of it

Look up interprocess synchronization via mutex.

Check whether bhs.dll is already loaded

```
if (!GetModuleHandle("bhs.dll"))  
{  
    // First time  
}
```

Obviously do this before bhs.dll is loaded in dllmain, as otherwise it would be loaded every time.

ahh, thanks!

EDIT: i tryed all the diffrent type of communication. but i couldn't find a good enough tutorial on one.

danpaul, your knowledge of C++ is pretty bad.
All variables are getting destroyed when the dll is loaded an other time. you they don't have their old value.

it was a simple answer, although, i have been testing and it works a charm! thanks, i would still be stuck otherwise

I don't usually work with .dll files, in a normal program static variables are static...

dan, im guessing...im not too sure how this works.

when the dll is reloaded, ALL of the variables are destroyed. but somehow my thread isn't

I am assuming that the thread remains intact because of the fact that it IS a separate thread.

Threads do not rely on each other to remain alive, unlike the parent->child relationship you can have with processes. You need to manually code something to close your thread once the .dll closes (I assume there is a function called when the .dll closes, so you should be able to use that)

dllmain.cpp, search for DLL_PROCESS_DETACH, put the code to kill your thread in there

will do. thanks

since this is about scripts.dll i have a question, is scripts 3.1 stable? and what benifits will it have on a FDS?
