I will first start out with my main question about renegade. Sometimes After i play renegade when im about to quit the game. I will hit this screen and when i hit the button the game locks.

<http://img149.imageshack.us/my.php?image=quitscreenhm8.png>

I will have to hold my power button in and restart my computer totally. Do any of you have this problem and how can i fix it im tired of ending the game through task manager.

Next question...

For those of you that use pt skins what are you using post a screen shot. I got a few hotties starring back at me...

WARNING LINK CONTAINS PARTIAL NIDITY

Usually, I can just hit Esc a bunch of time and the game will eventually close. If not, if you use custom scripts, you can use the 'exit' command in the console and the game will close right away.

To access the console command, do "F8" while you're in a game. Then there you can just type "exit".

Another way, if you got renguard: just alt-tab and close renguard; it will close renegade for you.

Maybe a reinstall could fix this? Check the reinstall sticky in this subforum.

Doubtful, it's a bug in Renegade made worse by scripts 3.x

The reason this happens is due to your graphics card setup. This bug occurs with most renegade's however if you have a radeon card it does not close after like 20 seconds.

When the black screen bug occurs your computer is under the impression everything closed properly, now if you load a full screen application the computer will load that and usually switch to it, thus fixing the frozen screen.

I setup shortcut keys to load full screen apps when this occurs... for example I hit Ctrl+alt+shift+a and it loads army of earth.

Nope, it's because of a bug in Renegade (it's not properly releasing all video card resources when being shut down). It happens exactly the same on all ATi, NVIDIA, S3, Matrox, PowerVR, 3Dfx, 3DLabs, VIA, SiS, Intel, and other manufacturer's video cards. Please don't go spreading misinformation

I get this every now and then on my machine (which has a NVidia card in it). The usual culprit is alt-tabbing out and back in in the last 15 or so minutes before client shutdown, or so it seems...

This has been happening for a while to me just i could never remember to ask about it lol.

What i have been doing to get around it is hitting the windows key and then ending it through task manager. Guess i will have to stick to this cause manually cutting your system isn't good for the pc.

I'm surprised none of you people use pt skins that's weird.

Oh and one last thing how do you do that spoiler thing people do in some forums???
